How To Add the Camera DVR Access to Mobile Devices:

1) Download the **Wirepath WPS-DVR Application** from the App Store

2) Once installed, launch the application

3) At the top left of the screen click "**Add**". Fill out the information as shown below:
   Device Name: *(Pick a name, Home would work for your main house)*
   Address: IP address or DDNS address
   Control Port: 67 *(Default)*
   Data Port: 68 *(Default)*
   User Name: *(The Username that we setup for you)*
   Password: *(The Password that we setup for you)*
   Number of Cameras: *(As available from the DVR)*
   Default View: *(Select which view you want to see when you first open the DVR device)*
   Video Stream: Record *(Default)*
    Auto Connect: On *(Default)*

4) After all the information is entered, double check it and then press "**OK**" at the top. This will bring you back to the Device List page where you should now see the one you just added.

5) Select the Device by **pressing the name** and if all information is entered correctly it will load your Default View and will show the live footage. (This may take a few seconds depending on network speeds)

Notes:
- If it doesn't load any of the cameras after 30 seconds to a minute some portion of the information that was entered may be incorrect. Go back to the Device List by selecting "**Devices**" at the top and **then press the arrow at the right side of the Name of your DVR Device.** This will bring up the fields where you entered all the information. Make sure that it is all correct, select "**OK**" and then try re-selecting your DVR Device from the list.

- If the Password is incorrect it will tell you when it tries to load up the cameras saying the password is incorrect. Go back into the information and re-enter the password and try again.
